

ls command lists the files and folders in the current directory. --all flag is used to list all the files & folders including the hidden from the user (starting with dot). I picked the command ls because ls is one of the core commands when working with the shell, without the ls command the user will not know the files that he/she can interact with. I picked the option --all because as a developer I need to know the hidden files and what they do, during my CS305 assignment I used this command, and it was useful.
